

EIA Solar Fleet Catalog

5,065 U.S. solar plants, engine-verified against federal 2024 generation

Section A — Prime Assets: 3,882 plants

Section B — Excluded Assets: 1,183 plants

Benchmark Run: 2026-07-07

Catalog Generated: 2026-07-11

Engine: v2.0.0 (pvlib ModelChain, NASA POWER irradiance)

Prepared by EcoXchange, Inc. — Data: U.S. EIA-923 / EIA-860 / USPVDB

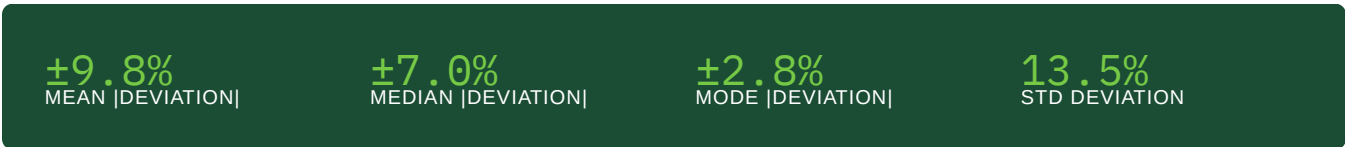

This catalog presents engine accuracy scores against federally reported generation. It is not an offer to sell securities, an appraisal, or a bankable resource assessment.

§ EXECUTIVE SUMMARY

The EcoXchange verification engine (v2.0.0) modeled expected annual generation for every joined EIA-923 solar plant — 5,065 plants — using pvlib ModelChain physics and NASA POWER satellite irradiance, then scored each plant against its federally reported 2024 generation.

The catalog separates the fleet into a prime cohort of 3,882 healthy plants (Section A) and 1,183 excluded plants (Section B): plants in high-curtailment grid regions (California and Texas, where grid-ordered output reductions systematically depress reported generation below physical capability) and provable underperformers (plants whose reported output indicates an operational problem — availability, shading, equipment — rather than model error).

PRIME COHORT — ENGINE ACCURACY (3,882 PLANTS)

ACCURACY DISTRIBUTION (PRIME COHORT)

Threshold	Share of plants
Within ±5% of reported generation	36.0%
Within ±10% of reported generation	66.3%
Within ±15% of reported generation	81.4%

FULL FLEET REFERENCE (ALL 5,065 PLANTS)

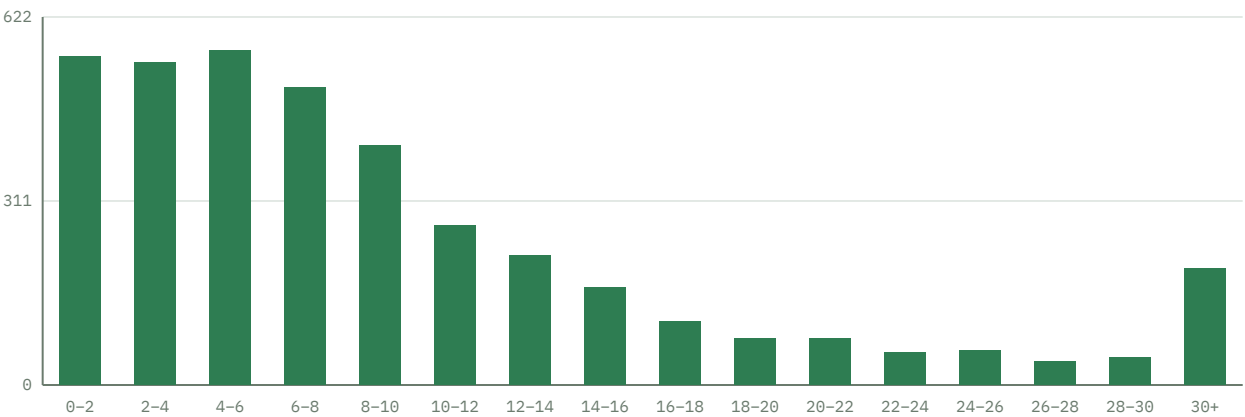

Including the excluded plants, the full-fleet mean absolute deviation is ±13.0% (median ±8.3%, mode ±2.8%, std 18.8%). The signed mean of +3.4% shows the physics is well-centered; the excluded cohort inflates the unsigned mean because sick plants under-produce relative to any physically correct model.

EXCLUSION RULE

Excludes plants in high-curtailment states (CA, TX) and plants reporting a capacity factor below 12.5% with more than 15.0% overprediction (presumed availability/curtailment issues, not model error). All exclusions are listed with reasons in the results JSON; full-fleet figures are published alongside. Exclusions: 796 in curtailment states, 436 provable underperformers (49 plants met both criteria). Every excluded plant is listed in Section B with its full score.

§ ACCURACY STATISTICS — PRIME COHORT

DISTRIBUTION OF ABSOLUTE DEVIATION (3,882 PLANTS)

Plants per 2-percentage-point bin of $|modeled - reported| / reported$. Mode bin centers near $\pm 2.8\%$; long right tail is real-world underperformance, not model bias.

TOP STATES (PRIME COHORT)

State	Plants	Mean Dev
NC	647	$\pm 8.7\%$
MN	444	$\pm 9.0\%$
MA	409	$\pm 8.4\%$
NY	359	$\pm 9.7\%$
NJ	195	$\pm 9.4\%$
CO	128	$\pm 11.5\%$
FL	128	$\pm 13.2\%$
GA	125	$\pm 8.1\%$
IL	123	$\pm 12.3\%$
MD	115	$\pm 10.6\%$

BY CAPACITY (PRIME COHORT)

Capacity	Plants	Mean Dev
< 1 MW	0	—
1–5 MW	2,094	$\pm 9.7\%$

5–20 MW	1,190	±9.2%
20–100 MW	398	±11.6%
100+ MW	200	±9.5%

Section A

Prime Solar Assets — 3,882 plants

Healthy plants outside high-curtailment grid regions whose reported generation is consistent with physical modeling. Engine accuracy on this cohort: mean $\pm 9.8\%$, median $\pm 7.0\%$, mode $\pm 2.8\%$, standard deviation 13.5%.

SECTION A – PRIME ASSETS (3,882 plants, state A-Z, largest first) – rows 1-26

Section B

Excluded Assets — 1,183 plants

Plants excluded from the prime cohort, listed in full with their scores. "Curtail" marks plants in high-curtailment grid regions (CA, TX) where reported generation is depressed by grid-ordered output reductions — a grid effect, not a plant defect or model error. "Underperf" marks plants whose reported output (overprediction > 15% with capacity factor < 12.5%) indicates an operational problem such as availability, shading, or equipment faults.

- Exclusion is a statistical classification for benchmark integrity, not a verified finding about any specific facility.
- Curtailment-state plants may be individually healthy; their reported output reflects grid conditions.
- Underperformance flags are derived solely from the deviation between modeled and reported generation.
- Scores for these plants are reported unmodified — nothing is hidden from the statistics.

§ METHODOLOGY & DISCLAIMERS

DATA SOURCES

Plant registry and geometry: U.S. Large-Scale Solar Photovoltaic Database (USPVDB) centroids and axis type; EIA-860 plant characteristics (tilt and azimuth where reported, NREL latitude rule otherwise; azimuth 180° default). Reported generation: EIA-923 monthly net generation, 2024. Irradiance: NASA POWER satellite daily data at each plant's coordinates.

PHYSICS MODEL

EcoXchange engine v2.0.0: pvlib ModelChain with Perez transposition and SAPM temperature model. Single-axis tracking plants are modeled with real tracking geometry. Loss and degradation assumptions are the engine defaults (14% system losses, 0.75%/yr degradation from commissioning year).

SCORING

Deviation % = $(\text{modeled} - \text{reported}) / \text{reported} \times 100$. Positive values mean the model predicted more energy than the plant reported. The prime cohort excludes plants where reported generation is known to be depressed for non-model reasons (grid curtailment in CA/TX; operational underperformance defined as overprediction > 15% with actual capacity factor < 12.5%).

LIMITATIONS

- This catalog is a model-accuracy benchmark, not a due-diligence report on any plant.
- Section B exclusion flags identify statistical patterns (curtailment exposure, underperformance), not verified operational facts about specific plants.
- EIA-reported generation is self-reported by operators and may contain errors.
- Tilt and azimuth are EIA-860 values where reported; otherwise estimated by the NREL latitude rule.
- The plants listed are real EIA-registered facilities and are not EcoXchange offerings; nothing in this catalog is an offer to sell or a solicitation to buy securities.
- Engine accuracy statistics are for the 2024 production year and may differ in other years.
